CVSUP-Mirror

Fetching ports from the internet is fine. Most of the time a sup-file with

  *default host=cvsup3.uk.freebsd.org

Inline emphasis start-string without end-string.

WOrks fine. However if you rebuild a machine regularly (you *can* build one from scratch cant you:-), it is a lot faster to download locally.

So we start up net/cvsup-mirror THis is a mirror of the cvs sites you normally find on the Internet. It can contain all the revisions of the source and the current ports tree so in theory you can build a 4.3 release version of BSD from you r local store

But we dont want to - we just want a fast local up to date copy of the source and ports trees.

make install clean on net/cvsup-mirror. Then answer the questions. Avoid taking things like the web and really avoid the mailing lists. Too big and unnecessary. At the time of writing the ports and sources bit is about 3.5G. THe first download will take a while.

Then alter __ /usr/local/etc/cvsup/cvsupd.access __
We want to add

  +10.137.0.0/16

Then ensure cvsup and cvsupin are in the /etc/passwd
Also check
/etc/rc.conf
cvsupd_enable="YES"
